#### Automatic Keypoint Detection on 3D Faces Using a Dictionary of Local Shapes

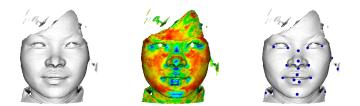

Clement Creusot, Nick Pears, Jim Austin

Advanced Computer Architecture group Department of Computer science THE UNIVERSITY of York

3DIMPVT, Hangzhou, China, May 2011

#### Aim

- What
- Why
- How
- Results
- Conclusion

- Keypoints detection (NOT LANDMARKS)
- Similar to any of 14 learnt features (Dictionary of local shapes)

#### What

Why

Long Term Objective

Gap in Research

How

Results

Conclusion

#### Most literature:

- 3 points max or single-point-of-failure design
- Weak features often discarded
- Almost no work on combining more than 2 descriptors
- Little literature that examine multiple descriptors over multiple scales
- Most people focused on landmarking, without giving the intermediate results on candidate detection (keypoints)

Conclusion

- Sparse selection (max 1%)
  - Reapeatable (same subject registration)
    - $\sim$ 75% (at 10 mm)
- Close to human hand-placed landmarks
  - average All:  ${\sim}85\%$  (at 10 mm)
  - average Nose: ∼99% (at 10 mm)
  - average Eyes:  ${\sim}90\%$  (at 10 mm)
- High proportion of the local shapes retreived
  ~11.88/14 (at 10 mm)

#### Conclusion

- What
- Why
- How
- Results
- Conclusion

- Good points:
  - Detects "weak" features
  - No single-point-of-failure design
- Limitations:
  - Can be time consuming article: 7s, now: 0.5s (8 desc.)
  - Linear combination of scores
- Future Work:
  - Non linear methods (boosting, kernel methods)
  - Structural matching to deduce correspondences
  - Comparison with a new clustering technique for keypoint detection
